

Challenge #8: External CSS and Responsiveness

Alright, let's sprinkle some magic on our Barangay Malongon website by taking your CSS game external. It's like giving our site a sleek makeover without cluttering up the HTML. Here's the lowdown:

Step 1: Create a CSS File

First things first, let's create a new file to house our style rules. Save it as styles.css. This is where the fashion party begins!

Step 2: Link It Up!

Now, in your HTML head, let's invite our style file to the party. It's like telling the browser, "Hey, the style rules are over here!"

```
<link rel="stylesheet" href="styles.css">
```

Making It Responsive:

We don't want our website to feel left out on different devices, right? Time to make it responsive!

```
<meta name="viewport" content="width=device-width, initial-scale=1.0">
```

This bit tells the browser to adapt the page to the width of the device. It's like your website saying, "Hey, I'll look good whether you're on a phone, tablet, or desktop!"

And there you have it! **External CSS** for that organized, stylish touch, and a sprinkle of responsiveness to make our site shine on any screen. Your website is now ready to steal the spotlight! 🌟 ✨
