Challenge #6: HTML Styles - CSS

Hey there! Let's dive into how we're spicing up the Barangay Malongon website with some HTML and CSS magic. We've got different styles in our toolbox – inline, internal, and external. Let's talk about each:

Inline Styles:

So, inline styles are like giving a unique flair to a specific element right in the HTML tag itself. For instance:

```html
<h1 style="color: #3498db; font-family: 'Arial', sans-serif;">
    Welcome to Barangay Malongon
</h1>
```

Here, we're coloring the text with a lovely blue shade and choosing a font style. Feel free to play around with these styles!

Internal Styles:

Now, internal styles are like putting your style rules in the head of your HTML file. Check this out:

```html
<head>
    <style>
        h2 {
            color: #2ecc71;
            font-size: 1.5em;
        }

        p {
            font-family: 'Helvetica', sans-serif;
        }
    </style>
</head>
```

This snippet says, "Hey, any <h2> should be green-ish and a bit bigger, and all <p> elements should rock the 'Helvetica' font."

But wait, if you want to keep things tidy, you can throw those styles into a separate CSS file (like styles.css):

```css
.news-section{
    padding: 40px 0 100px;
}
.news-marginer {
    width: 1200px;
    margin-inline: auto;
}
.news-flex {
    display: flex;
    flex-wrap: wrap;
}
```

Now link that CSS file in your HTML head:

```html
<head>
    <link rel="stylesheet" href="styles.css">
</head>
```

Make sure your CSS file path is spot on!

And there you have it – a quick tour of how we're dressing up the Barangay Malongon website with some snazzy styles. Play around, find your groove, and let the creativity flow!
